January 19, 1906
 Left Zamboanga at 10 P.M.
 on S.S. Sabah, Capt. Waddell.

January 20, 1906.

This morning a great number of sea birds were numerous, but I was asleep and did not see them. When I awoke I saw one Booby. No other birds seen during the day, and no other marine life observed.

We started for Palawan Island 75 m. E of the south end of Mindanao Jan 21. We arrived in Palawan Island at 2 P.M. & remained until 6 P.M. Started at once to hunt. I began shooting large 7 mit Pigeons similar to Muscadivore Pigeons. Altogether the party brought in 160 of them. One of Wood got a dozen with small caliber rifle, and I 25 with shotgun. The Pigeons were very tame, but strong birds. When shot, quite frequently they would cling to the branch head down for some moments before falling. Their note was a loud booming sound.

Lizards numerous. Land and Sea shells, lizards & plants were gathered.

The name of Palawan I. is Mianar in the language of the natives. They cultivate coconuts, Corn, Indian corn, Tapioca, ^{guboy} sugarcane, lily, banana, breadfruit, hemp. They had a school and a church. They build good boats and ^{rafts}. Their animals were limited to chickens. No ponies, carabao, cattle, pigs, dogs or cats.

The natives stated positively that there were no small indigenous birds. No small birds were seen by us; but we saw several hawks the size of Cooper's, with somewhat shorter tail & heavily crossbarred below. They were quite shy. Whenever the guns were fired the Black Duck would scream. I shot a female.

Three Bats (Spectrum) were seen. One in deciduous fruit tree & 2 in coconuts.

No little bird and no Kingfishers were known to inhabit the island.

No shore birds except a Brown Rail seen in a marshy jungle by Major Stanley.

Birds collected on Palawan Is.

"Palmas or Misanga Island, lying about 75 miles eastward of the south end of Mindanao, is about 300 feet high and 1 mile in extent east and west. It is situated approximately in lat. $5^{\circ} 35' N$, long. $126^{\circ} 36' E$. Anchorage may be had in a small open bay at the southeast part of the island, in a depth of 19 fathoms with a flagstaff near the shore in the bright bay bearing $N. 43^{\circ} W$. ($N. 45^{\circ} W$. mag.), distant 450 yards; the shore reef extends off to the distance of about 100 yards."

Plan of southeast anchorage on C. and D. I. chart No. 4724.

"Philippine Islands Sailing Directions Section V. Coasts of Mindanao and Adjacent Islands. Second Edition, 1905, page 47"

January 23, 1906.

for _____ Regiment _____

3-1357

In Hospital or Quarters.

PRESCRIPTION AND REMARKS.

"Balut Island, the westernmost of the two [Sarangani Islands], is the larger, higher, and best cultivated. In the center is a volcano, from which smoke sometimes issues, having an elevation of 3,117 feet; seen from the northwest it appears between two peaks. Near the southwest point there is another volcano and in the southeast part a hill 1,083 feet high. The north and east coasts are bordered by a reef which in some places extends out over 1 mile, while on the south and west sides the fringing reef does not extend to any distance. Off the southwest point is a rock 40 feet high."

(From P. I. S. D. Section V.)

The only mammals seen were Monkey & Bats of which Lieut. Johnston got specimens for me. I saw several lizards having green heads & green underparts. Specimen preserved. The Brook Crab is also seen for I saw carcasses but none alive.

January 23 - Continued.
